TD

Data Engineer

Toronto, Ontario, Canada

Dear Hiring Manager,

I am applying for the Data Engineer role at TD. I am a Computer Science and Statistics student at the University of Toronto with hands-on experience building production data pipelines, backend services, and NLP systems. My strongest match for this role is practical Python ETL development, production pipeline ownership, and improving data quality for downstream consumers—skills I developed while delivering ingestion and classification systems at Royal Bank of Canada.

At Royal Bank of Canada I designed and implemented a Python (Pandas) CDC pipeline to clean and transform large datasets, generate surrogate keys, and keep records in near-real-time sync across multiple sources. That work included separating new, updated, and closed units for downstream systems and diagnosing pipeline failures to keep data flowing. I also re-engineered a transit hierarchy used in risk assessment by matching records across legal entity, location, and financial fields, and built a React validation app with backend services to manage hierarchy changes. Those projects required close collaboration with source owners, API-based integrations, and attention to data governance and quality—directly relevant to onboarding sources, building secure ETL, and producing curated data products.

In addition, I built an end-to-end NLP pipeline in spaCy to convert free-text incident reports into structured fields: I labeled a historical dataset and trained a supervised classifier to auto-tag event type, business line, and root cause to improve searchability and reuse. At Deutsche Telekom I delivered Java backend services and integrated workflow engine APIs for an office automation application, which reinforced working with authentication patterns and service connectivity. My personal projects include full-stack apps using PostgreSQL and Supabase with OpenAI integration, which demonstrate end-to-end ownership, database provisioning, secure APIs, and use of AI-assisted development tools for productivity and testing.

I bring practical experience building Python-based ingestion pipelines, supervising data quality workflows, and delivering backend services that integrate with source systems. I can apply those patterns to Databricks notebooks and scalable Spark-based ETL, and I am ready to work with platform, networking, and partner teams to onboard sources and maintain reliable, high-performance pipelines at TD as a Data Engineer. I welcome the opportunity to discuss how my background can support your data ingestion and curated product goals.

Sincerely,

Eric Li
