Questrade Financial Group (QFG)

Principal Data Scientist

Canada (hybrid, at least 3 days in office)

Dear Hiring Manager,

I am applying for the Principal Data Scientist role at Questrade Financial Group. I am a Computer Science and Statistics student at the University of Toronto and have one year as a Data Engineer at Royal Bank of Canada plus prior software engineering experience at Deutsche Telekom. My strongest match for this role is delivering end-to-end production data pipelines and analytics outputs using Python and SQL, building traceable, auditable solutions in a regulated environment, and applying AI/NLP to accelerate data workflows.

At Royal Bank of Canada I owned multiple production pipelines and data products that align directly with Questrade's responsibilities. I designed a Python/Pandas CDC pipeline to clean and transform large datasets, generate surrogate keys, and maintain near real time synchronization across sources while separating new, updated, and closed records for downstream consumers. I re engineered the transit hierarchy used for risk assessment by matching entities across legal, location, and financial dimensions, and built a React validation app with backend services to manage hierarchy changes and improve data quality and ownership. I also implemented an end to end NLP pipeline in spaCy to convert free text incident reports into structured fields, labeled the historical dataset, and trained a supervised classifier to auto tag event type, business line, and root cause, improving searchability and reuse of past risk events. These projects required clear metric definitions, lineage, and collaboration with risk and compliance stakeholders to ensure auditability.

Earlier I built Java backend services and workflow integrations at Deutsche Telekom, implementing CRUD and workflow APIs for office automation. I've also built full stack products using PostgreSQL and Supabase, including an AI powered job application platform that integrates OpenAI for job description analysis and automated cover letter generation. Those projects used Docker for containerization and Git for shared codebases, and they demonstrate an AI first approach to accelerate engineering and analytics tasks through model assisted labeling, generative prototypes, and automation.

I bring hands on Python and SQL pipeline ownership, experience operating within banking compliance constraints, and concrete AI/NLP implementations that speed data exploration and automation. I am comfortable translating existing pipeline patterns to cloud analytics platforms and integrating containerized services into CI/CD-driven deployments. I welcome the opportunity to discuss how my background delivering traceable, production analytics and AI enabled tooling can support Questrade Financial Group as Principal Data Scientist.

Sincerely,

Eric Li
