TD

Data Engineer

Toronto, Ontario, Canada

Dear Hiring Manager,

I am applying for the Data Engineer role at TD. I am a Computer Science and Statistics student at the University of Toronto with hands-on experience building production ETL and data-quality systems in Python, backend services, and NLP pipelines. My strongest match for this role is practical Python-based ingestion and transformation work at scale, combined with API and backend experience that supports secure source onboarding and downstream data products.

At the Royal Bank of Canada I designed and implemented a Python (Pandas) CDC pipeline to clean and transform large datasets, generate surrogate keys, and keep records in near-real-time sync across multiple sources. I separated new, updated, and closed units for downstream consumers and re-engineered the transit hierarchy used for risk assessment by matching records across legal entity, location, and financial metrics. To make that work operational, I built a React validation app with backend services to manage hierarchy changes and improve data quality. Those projects required end-to-end ETL ownership, data lifecycle thinking, and close collaboration with source owners and downstream teams—responsibilities that map directly to designing, building, and maintaining ingestion pipelines at TD.

I also built an end-to-end NLP pipeline in spaCy to convert free-text incident reports into structured fields, labeling historical data and training a supervised classifier to auto-tag event type, business line, and root cause to improve searchability and reuse. At Deutsche Telekom I implemented Java backend services and integrated workflow-engine APIs, including CRUD and workflow endpoints. My personal projects include full-stack systems backed by PostgreSQL and deployed services, demonstrating practical SQL, relational database design, API work, and use of developer tooling such as Docker and OpenAI API for automation and analysis.

I am a Canadian citizen eligible to work in the United States under TN (USMCA) status for qualifying professional roles. TN status does not require traditional employer-sponsored visa petitioning or H-1B processing, and I can present the required documentation at a U.S. port of entry.

I will bring practical Python ETL experience, a focus on data quality and curated data products, and hands-on API and backend skills to the TD Data Engineer role. I am prepared to apply my production pipeline patterns to Databricks, Spark/PySpark, Azure Data Factory, ADLS, and Delta Lake environments and to collaborate with platform, networking, and source teams to onboard and stabilize new sources. I look forward to discussing how I can contribute to TD's ingestion framework and pipeline reliability.

Sincerely,

Eric Li
